Professional Summary

Staff Backend Engineer with 13+ years of experience designing and building enterprise-scale distributed systems, cloud-native SaaS platforms, and AI-enabled backend applications. Strong expertise in Golang, Node.js, Java, AWS, Kubernetes, microservices, distributed systems, REST APIs, and cloud-native architecture.

Experienced in designing scalable backend platforms, event-driven systems, enterprise integrations, and highly available services. Proven ability to drive architectural decisions, improve system performance, mentor engineers, and deliver reliable software for enterprise customers. Hands-on experience with MongoDB, PostgreSQL, MySQL, Kafka, observability, semantic search, and modern software engineering practices.

Core Skills

Languages: GoLang, Java, Node.js

Backend: Distributed Systems, Microservices, REST APIs, System Design, Event-Driven Architecture

Cloud & Containers: Kubernetes, Docker, AWS, Azure, GCP

Messaging: Kafka

Databases: PostgreSQL, MySQL, Mongo DB, OpenSearch, Ferret DB, Vector Databases

Security: OAuth2, OIDC, JWT

Observability: Structured Logging, Metrics, CI/CD

AI: Generative AI, RAG, Ollama, ChromaDB

Professional Experience

Pentaho — Hyderabad — Software Development Engineering Specialist Professional (Jun 2023 - Present)

- Designed a distributed metadata ingestion platform using worker-based orchestration and connector micro-services for enterprise metadata intelligence and data catalog workflows.

- Designed extensible connector microservices for Power BI, Tableau, and MLflow, enabling independent deployments, fault isolation, and simplified onboarding of new metadata providers.
- Reduced metadata re-ingestion time by ~50% through incremental synchronization using last-modified bookmarks.
- Increased ingestion throughput through concurrent processing using goroutines, worker pools, and asynchronous execution.
- Designed resilient distributed workflows using retries, eventual consistency, recovery jobs, and incremental checkpoints to recover from partial failures.
- Designed and optimized the primary metadata datastore using MongoDB to support scalable storage and retrieval for enterprise metadata.
- Worked on the migration of the metadata platform from MongoDB to FerretDB due to licensing changes, ensuring application compatibility with minimal operational impact.
- Implemented end-to-end observability using structured logging, correlation IDs, health endpoints, and operational metrics.
- Developed AI-powered metadata assistant leveraging semantic search and vector similarity.

Concentrix — Bengaluru — Senior Software Engineer II (Dec 2021 - Jun 2023)

- Developed distributed Golang backend services integrating Vertex AI and YOLO for automated compliance monitoring.
- Improved inference throughput by ~30% through backend optimization and scalable processing pipelines.
- Built production-grade AI workflows with emphasis on resiliency, monitoring, and scalable service integration.
- Lead the integration of the API gateway (Apache APISIX) with supported plugins of rate-limiting, retry & fallback and promoted the complete architecture to production.

Hitachi Vantara — Bengaluru — Software Development Engineer Senior (Oct 2018 - Dec 2021)

- Designed cloud-native distributed services supporting multi-tenant SaaS deployments across AWS, Azure, and GCP.
- Reduced Kubernetes cluster provisioning time through asynchronous orchestration and parallel infrastructure creation.

- Built orchestration APIs enabling scalable lifecycle management and independent service scaling.
- Designed and built a Smart Data Center solution which consolidates and correlates data from multiple data centers and business units. Gain analytic insights to lower costs and streamline services for disparate users across data centers using Bigdata tools.
- Designed and built a multi cloud cost-savings and analyzer platform by extending open source Kubecost. Project aims in savings for public and private clouds. Analyzes cost associated with each of the Kubernetes cluster resources in the supported cloud platforms like AWS, GCP, Azure etc.

Altisource Business Solutions Pvt Ltd — Bengaluru — Software Engineer (Jul 2013 – Jul 2018)

- Modernized legacy Java applications by migrating critical services to Spring Boot.
- Designed modular backend services supporting mortgage servicing, foreclosure, auction, and credit reporting platforms.
- Built REST APIs are consumed by enterprise applications while improving maintainability through modular architecture.
- Designed MongoDB data models for mortgage modification documents, enabling efficient document storage, retrieval, and lifecycle management.
- Mentored engineers promoted CI/CD practices, and improved engineering quality through code reviews.
- Delivered multiple production releases with zero critical post-release incidents through rigorous testing and collaboration.

Certifications

- LLM Foundations: Vector Databases for Caching and Retrieval Augmented Generation (RAG)
- Generative AI: Introduction to Large Language Models

Professional Development

- AWS SimuLearn – AI Practitioner – Training Badge
- AWS Knowledge: Compute – Training Badge

Education

Bachelor of Engineering (Information Science & Engineering)

Visvesvaraya Technological University (VTU), 2009–2013
